1 Overview

This document specifies the HTTP based application programming interface of video products.

The HTTP-based interface provides the functionality for requesting snapshot and media stream, for controlling camera functions (PTZ, Focus etc.) and for getting and setting internal parameter values.

The video products serve as a server. The client sends requests to server, and then server handles requests and returns resources accordingly.

3 Definitions

3.1 Abbreviations

The following abbreviations are used throughout this document

API Application programming interface – in the document, it especially presents application programming interface of video products.

3.2 Syntax convention

- In URL syntax and in descriptions of API parameters, text in italic within angle brackets denotes content that should be replaced with either a value or a string. When replacing the text string, the angle brackets must also be replaced. For example, <server> in the URL syntax is replaced with the string “192.168.1.108”.
- String shown in bold face denotes a brief explanatory note of the string close to it.
- Name-value pair in square brackets denotes content that is optional. For example,

“`http://<server>/cgi-bin/snapshot.cgi[?channel=<ChannelNo>]`” can be like this
 “`http://<server>/cgi-bin/snapshot.cgi`”.

- The API syntax must follow the standard of URI. (RFC 3986: Uniform Resource Identifiers (URI) Generic Syntax); that is, spaces and other reserved characters (“;”, “/”, “?”, “:”, “@”, “=”, “+”, “,” and “\$”) within a name-value pair should be replaced with %< ASCII hex>. For example, the blank should be replaced with %20.
- To describe the range of a variable, we use some symbols such as “[]” and “{ }”. For example: “[0-100]” denotes an integer not less than 0 and not larger than 100. “{0, 1, 2, 3}” denotes the valid value of an integer among 0, 1, 2 and 3.
- “[]” following a string denotes an array. The index is usually an integer and starts from 0. For example, “`Snap[channel]`” may be “`Snap[0]`” or “`Snap[1]`”.
- The variable may be different types: string, integer, bool or float. Integer is 32 bits. The range of bool is “true” and “false”.

3.3 API format

This section defines the syntax and semantics for APIs.

```
<protocol>://<server><abs_path> [?query]
```

protocol: URL scheme for the particular request. The http and https protocols are both supported in this specification. So “http”, as most of the APIs’ default protocol except several RTSP APIs, can be replaced by “https”.

server: Server could be “**hostname[: port]**”. The **hostname** can be IP address or the fully qualified domain name of an IP device. The **port** is the port number of **server** listening for TCP connections. If the port is not given, the default port is assumed. For HTTP, the default port is 80. For HTTPS, the default port is 443.

abs_path: The Request-URI for the resources is abs_path. The abs_path in this specification is most often of the form “/cgi-bin/* .cgi”.

query: The query field is a string of information to be interpreted by the resource. It consists of resource-related parameters. And it must be listed in name-value pair syntax (p1=v1&p2=v2&...&pn=vn).

For example:

`http://192.168.1.108/cgi-bin/snapshot.cgi?channel=1`

3.4 Server responses

The server uses the standard HTTP status codes.

Return:

```
HTTP/1.1 <HTTP code> <HTTP text>\r\n
```

With the following HTTP code and meanings

Table 3-1

HTTP code	HTTP text	Description
200	OK	The request has succeeded. The requested resource will be returned in the HTTP text.
400	Bad Request	The request had bad syntax or was inherently impossible to be satisfied.
401	Unauthorized	The request requires user authentication or the authorization has been refused.
404	Not Found	The server has not found anything matching the request.
500	Internal Server Error	The server encountered an unexpected condition that prevented it from fulfilling the request.

Example: request doesn't fit with syntax.

```
HTTP/1.1 404 Not Found\r\n
```

If the request fits with syntax but an error occurs while the server handles it, the response would like this:

```
HTTP/1.1 200 OK
...
Error
ErrorID=<Error Code>, Detail=<Error Description>
```

Example: Request spells wrong.

```
HTTP/1.1 200 OK
Error
ErrorID=2, Detail= Invalid Request!
```

All error codes are defined as below.

Table 3-2

Error Code	Detail	Description
0	Invalid Authority!	The user fails in authentication or doesn't include the right accessing the resource.
1	Request parses error!	Request is incomplete.
2	Invalid Request!	Request spells error.
3	Method not found!	the resource not supported
4	Request invalid param!	Parameters of request are invalid.
5	Server internal error!	An error occurs when server handles the request.
6	Request Timeout!	Timeout when server handles request.
7	Client keepalive failed!	The client fails to keep alive.

3.5 Authentication

Video products support either basic authentication or digest authentication. If the http request does not provide valid "Authorization" information, video products would return HTTP status code 401 and information for authentication. Video products return the required resource only if authorization correct.

For example:

1. When basic authentication fails, response is:

```
HTTP/1.1 401 Unauthorized
```

```
WWW-Authenticate: Basic realm="XXXXXX"
```

The client encodes the username and password with base64, and then sends it to server. A valid Authorization like this:

```
Authorization: Basic VXZVXZ
```

2. When digest authentication fails, response is:

```
HTTP/1.1 401 Unauthorized
```

```
WWW-Authenticate: Digest realm="DH_00408CA5EA04",
nonce="000562fdY631973ef04f77a3ede7c1832ff48720ef95ad", stale=FALSE, qop="auth"
```

The client calculates the digest authorization using information like username, password, nonce, HTTP method and URI with MD5, and then sends it to server.

For example:

```
Authorization: Digest username="admin", realm="DH_00408CA5EA04", nc=00000001, cnonce="0a4f113b",
qop="auth", nonce="000562fdY631973ef04f77a3ede7c1832ff48720ef95ad",
uri="/cgi-bin/magicBox.cgi?action=getLanguageCaps", response="65002de02df697e946b750590b44f8bf"
```

4 General APIs

The requests specified in this section are supported by all video products.

4.1 APIs of RTSP

4.1.1 Get real-time stream

Table 4-1

Syntax	<code>rtsp://<username>:<password>@<ip>:<port>/cam/realmonitor?channel=<ChannelNo>&subtype=<ty</code>
--------	--

	<i>peNo></i>
Description	Get real-time media stream.
Example	We request the extra stream 1 of channel 1, the URL is: rtsp://admin:admin@10.7.6.67:554/cam/realmonitor?channel=1&subtype=1
Success Return	media stream data
Comment	<p><username>: a valid user's username.</p> <p><password>: user's password.</p> <p><ip>: the IP address of the video product.</p> <p><port>: the default port is 554. It can be omitted.</p> <p><ChannelNo>: integer, the video channel index which starts from 1.</p> <p><typeNo>: the stream type. The <typeNo> of main stream is 0, extra stream 1 is 1, extra stream 2 is 2. The extra stream counts can be obtained in GetMaxExtraStreamCounts. If the stream does not exist or not enabled, response will be error.</p> <p>The IP Camera supports both TCP and UDP transmission forms.</p> <p>It also supplies basic authentication and digest authentication ways. The authentication process is similar with Authentication.</p>

4.1.2 Get playback stream

Table 4-2

Table 4-101

Syntax	http://<server>/cgi-bin/configManager.cgi?action=setConfig&< paramName >=< paramValue >[&< paramName >=< paramValue >...]
Method	GET
Description	Set Motion Detect config.
Example	<p>Enable motion detection:</p> <p>http://192.168.1.108/cgi-bin/configManager.cgi?action=setConfig&MotionDetect[0].Enable=true</p> <p>Set motion detection regions:</p> <p>http://192.168.1.108/cgi-bin/configManager.cgi?action=setConfig&MotionDetect[0].MotionDetectWindow[0].Region[0]=1&MotionDetect[0].MotionDetectWindow[0].Region[1]=1&MotionDetect[0].MotionDetectWindow[0].Region[2]=1&MotionDetect[0].MotionDetectWindow[0].Region[3]=1&MotionDetect[0].MotionDetectWindow[0].Region[4]=1&MotionDetect[Channel].DetectVersion=V3.0</p>
Success Return	OK
Comment	<p>In below table,</p> <p>head = MotionDetect[Channel]</p> <p>Channel: video channel index</p> <p>LineNum</p> <p>Index of region, region is divided into lines and each line has several blocks, a line is described by a 32 bit integer, a bit for a block.</p> <p>0=Line 1</p> <p>1=Line 2</p> <p>...</p>

	<p>WinNum</p> <p>Index of detect window, there are 4 detect windows at present. Each window is divided into 18 lines and 22 blocks per line.</p> <p>Notice: When setting “MotionDetect [<i>Channel</i>].MotionDetectWindow [<i>WinNum</i>].Region”, you need to contain the parameter “MotionDetect [<i>Channel</i>].DetectVersion=V3.0” along.</p>
--	--

Appendix:

ParamName	ParamValue type	Description
head.Enable	bool	Enable/Disable motion detect feature in a channel.
head.EventHandler		Setting of EventHandler is described in SetEventHandler
head.MotionDetectWindow [<i>WinNum</i>].Id	integer	It is the Id of a detect window.
head.MotionDetectWindow [<i>WinNum</i>].Name	string	It is the name of a detect window.
head.MotionDetectWindow [<i>WinNum</i>].Sensitive	integer	Range is [0-100]. Sensitivity of motion detection. It presents more sensitive if the value is larger.
head.MotionDetectWindow [<i>WinNum</i>].Threshold	integer	Range is [0-100]. It presents the threshold value when trigger motion detect.
head.MotionDetectWindow [<i>WinNum</i>].Region[<i>LineNum</i>]	integer	It is similar with head.Region [LineNum]. Currently, a region is divided into 18 lines and 22 blocks per line. A bit describes a block in the line. Bit = 1: motion in this block is monitored. Example: MotionDetect [0].Region [0] = 4194303 (0x3FFFFF): the 22 blocks in channel 0 line 0 is monitored. MotionDetect [0].Region [1] = 0: the 22 blocks in channel 0 line 1 is not

		monitored. MotionDetect [0].Region [17] = 3: the left two blocks in the last line of channel 0 is monitored.

15 Appendix

This section contains stream format. The Stream format is applied to [Get real-time stream](#) and [Get playback stream](#).

15.1 Stream head

Byte Order	0	1	2	3	4	5	6	7

Key	Flag	Type	reserved	packet length
-----	------	------	----------	---------------

Byte Order	8	9	10	11	12	13	14	15
Key	channel		Extend header length		Sequence			

Byte Order	16	17	18	19	20	21	22	23
Key	utc			utcms		reserved	Check sum	

Flag="DH";

Type=0x10 means the audio packet;

Type=0x20 means the video packet;

Type=0x21 means the auxiliary packet;

Packet length means the packet total length, contains the packet header, maybe one or more extend header, and the media data.

15.2 Extend Header

Byte Order	0	1	2	3	4	5	6	...
Key	Type	length		reserved	data			

Extend header length must be multiple of 4 bytes;

15.2.1 Audio extend header

Byte Order	0	1	2	3	4	5	6	7
Key	0x11	8		reserved	Audio Type	Tracks	Sample Freq	reserved

Byte Order	8	9	10	11	12	13	14	15
Key	OperateId				reserved			

A audio packet must contain the audio extend header;

Audio Type: 1 - PCM8; 2 - G729; 3 - IMA_ADPCM; 4 - G711U; 5 - G721; 6 - PCM8_VWIS; 7 - MS_ADPCM; 8 - G711A; 9 - AMR-NB; 10 - PCM16; 11- G723.1; 12 – AAC; 13 - G726_40; 14 - G726_32; 15 - G726_24; 16 - G726_16

Tracks: Tracks number, support 1 and 2;

Sample Freq: audio sample frequency, 1 - 4000; 2 - 8000; 3 - 11025; 4 - 16000; 5 - 20000; 6 - 22050; 7 - 32000; 8 - 44100; 9 - 48000;

OperateId: it is valid when playback, which means this packet match with the playback control command.

15.2.2 Video extend header

Byte	0	1	2	3	4	5	6	7
------	---	---	---	---	---	---	---	---

Order								
Key	0x21	16		reserved	Video Type	Frame Type	Width	

Byte Order	8	9	10	11	12	13	14	15
Key	Height		I Frame Interval	Frame Rate	Operateld			

A video packet must contain the video extend header; Video Type means the video codec type, 1-MPEG4; 2-H.264; Frame Type: 1-I frame; 2-P frame; 3-B frame; Width and Height describe the frame width and height by pixel; Operateld is valid when playback, which means this video packet match with the playback control command.

15.2.3 Channel title extend header

Byte Order	0	1	2	3	4	5	6	...
Key	0x22	len		reserved	Title ...			

When a stream begin, or the device channel title changes, the video packet must contain the channel title extend header; if the channel title is Chinese, it only support utf8 format.

15.2.4 Time zone extend header

Byte Order	0	1	2	3	4	5	6	7
Key	0x31	8		reserved	Time Zone		Daylight	reserved

						saving time	
--	--	--	--	--	--	-------------	--

When a stream begin, or the Time Zone changes, the video packet must contain the Time Zone extend header; Time Zone [0]: [-12, 12](west time zone 12 to east time zone 12), Time Zone[1] modify the time by minutes; Daylight saving time: 1/0, yes or not in daylight saving time;

15.2.5 Event flag extend header

Byte Order	0	1	2	3	4	5	6	...
Key	0x23	len	reserved	Event Flag				

If the video frame contains one or more event flags, the video packet should contain the Event Flag Extend Header. The event flag means what event had happened by set the bit as 1;

Event Flag: bit0-exterior alarm; bit1-move detect; bit2-video lost.

15.2.6 auxiliary gap extend header

Byte Order	0	1	2	3	4	5	6	7
Key	0x24	Len(24)	reserved	OperateId				

Byte Order	8	9	10	11	12	13	14	15
Key	startTime				beginMs		reserved	

Byte Order	16	17	18	19	20	21	22	24
Key	endTime				endMs	reserved		

If there is a gap between the video frames, the auxiliary packet may contain the gap extend header,

the first timestamp means gap start time, the second timestamp means gap end time.

OperateId: it is valid when playback, which means this packet match with the playback control command.
